AUTHORS: Serdyukova, A. S., Kapitanov, Yu. T.

75-1-14/26

TITLE: The Application of Radiometric Methods for the Simultaneous Separate Determination of the Content of Uranium, Thorium, Radium and Potassium in Acid Igneous Rocks (Primeneniye radiometricheskikh metodov dlya odnovremennogo razdel'nogo opredeleniya sodержaniya urana, toriya, radiya i kaliya v kislykh izverzhennykh porodakh)

PERIODICAL: Zhurnal Analiticheskoy Khimii, 1958, Vol. 13, Nr 1, pp. 88-94 (USSR)

ABSTRACT: For the separate determination of the content of uranium, thorium, radium and potassium in acid igneous rocks the authors used a combination of α -, β -, γ - and γ -discrimination measurement. As a result they obtained the following set of equations:

$$A_{\alpha} = \alpha_1 U + \alpha_2 Ra + \alpha_3 Th$$

$$A_{\beta} = \beta_1 U + \beta_2 Ra + \beta_3 Th + \beta_4 K$$

$$A_{\gamma} = \gamma_1 U + \gamma_2 Ra + \gamma_3 Th + \gamma_4 K$$

$$A_{\gamma_2} = Ra + \gamma_1' Th + \gamma_2' K$$

Card 1/5

The Application of Radiometric Methods for the Simultaneous Separate Determination of the Content of Uranium, Thorium, Radium and Potassium in Acid Igneous Rocks 75-1-14/26

In these equations A_α , A_β , A_{γ_1} and A_{γ_2} denote the activities of the samples to be investigated, expressed in equivalent percents of uranium in equilibrium. $\alpha_1, \alpha_2, \alpha_3, \beta_1, \beta_2, \beta_3, \beta_4, \gamma_1, \gamma_2, \gamma_3, \gamma_4, \gamma_1'$ and γ_2' denote the equivalent percents of uranium in equilibrium for uranium, the radium group, thorium and potassium according to the α -, β -, γ - and γ -discrimination measurements. This set of equations can be solved by means of determinants which then yield the formulae for the determination of every individual element. The coefficients of the above-mentioned set of equations can be determined in a theoretical way or, still better, experimentally. In order to obtain exact values in the experimental determination, the standard mixtures must satisfy the following requirements:

- 1) Equilibrium with the decay products and absence of other radioactive elements in the radioactive initial material.
- 2) A low radiation coefficient (not above 10%) of the uranium and thorium compounds in equilibrium.
- 3) A uniform composition of the substances used for measuring α -radiation and a uni-

Radium and Potassium in Acid Igneous Rocks

75-1-14/26

form composition (or one that is in keeping with density and the effective ordinal number) in the measurement of the β - and γ -radiation. The composition of the substances may be chosen ad lib. in the determination of the coefficients, but it must be uniform for all mixtures. 4) A uniform distribution of the radioactive elements in the prepared standard mixtures. - The values of the coefficients are practically independent of the content of radioactive substances in the standard mixtures. For increasing statistical accuracy, however, it is expedient to use mixtures with high contents of radioactive elements (up to 0.1% of the radioactive initial element). The coefficients determined in this way permitted the elaboration of a method for the separate determination of uranium, thorium, radium and potassium in acid igneous rocks. The investigation of artificial mixtures with a weight of 140 g and a content of $6.10^{-4}\%$ U, $18.10^{-4}\%$ Th, $2.10^{-10}\%$ Ra and 9% K showed satisfactory results. These concentrations are lower by almost one order of magnitude than the corresponding concentrations in the granites for the analysis of which

Card 3/5

The Application of Radiometric Methods for the Simultaneous Separate Determination of the Content of Uranium, Thorium, Radium and Potassium in Acid Igneous Rocks 75-1-14/26

the determination was worked out. For the successful employment of the method of the separate determination of the content of uranium, thorium, radium and potassium in rocks the proper choice of the standard mixtures and the taking into account of all factors that exercise an influence on the results of measurement are extremely important. The separate determination of low contents of uranium, thorium, radium and potassium can be performed by means of any apparatus satisfying the following requirements: a) high sensitivity, b) sufficient stability in use in order to warrant constancy of the coefficients during the long duration of the measurement. There are 1 figure, 5 tables, and 4 references, 3 of which are Slavic.

TITLE: A rapid method of determining the concentration of radium A and the ratios between the decomposition products of radon in air.

PERIODICAL: Referativnyy zhurnal, Khimiya, no.11, 1962, 370, abstract 11 I 338, (Izv. vyssh. uchebn. zavedeniy. Geol. i razvedka, no.11, 1961, 106-114).

TEXT: Making two counts and using a calibrated transparent sheet (the method of its construction is given) or the table (given) and a slide rule, the method permits the determination of the concentration of RaA and the ratio of $RaA : RaB : RaC$ in air, in 13 minutes with an accuracy sufficient for practical purposes ($\pm 10\%$ at a level of $1 - 10^{-10}$ curie/litre). The sheet, as well as the table, were calculated for 2 minutes sampling and for the time intervals of measuring α -activity of the filter of 2.5 - 3.5 minutes - A(3), and 9.5 - 10.5 minutes - A(10).

TITLE: Azimuthal dependence of group velocities of Rayleigh surface seismic waves based on observations in Simferopol'

SOURCE: AN UkrSSR. Geo izicheskiy sbornik, no. 18, 1966.
Geofizicheskiye issledovaniya stroyeniya zemnoy kory (Geophysical investigations of the structure of the earth's crust), 94-98

TOPIC TAGS: earth crust, seismic wave propagation, upper mantle, earthquake, Rayleigh wave, velocity profiling, group velocity dispersion, *SHOCK WAVE VELOCITY*

ABSTRACT: The results of observations of group velocity dispersion of Rayleigh surface waves conducted in the period 1957—1964 by the "Simferopol'" seismic station are presented. A standard SVK [Kirnos vertical system seismograph] was used in conjunction with a special long-period vertical seismograph to record 53 earthquakes whose foci were located in the Earth's crust and whose epicentral distances ranged from 3500 to 16,800 km. The magnitude of the earthquakes varied in the range $5 \frac{1}{4} < M < 7 \frac{1}{2}$, the periods of the dispersed waves were in the 10—100-sec interval, and

Card 1/3

UDC: none

ATC NR. AT7003838

the group velocities ranged from 2.7 to 4.0 km/sec. The azimuths from Simferopol' to the epicenters of most events were in the 0 to 90° interval, i.e., originating in Eurasia. The technique of calculating the azimuthal dependence of group velocities by periods made it possible to determine the direction of the wave paths corresponding to extremal velocity values, thereby indicating the generation and propagation of surface waves from the block regions having the greatest crustal thickness or - in the case of longer period waves - of the upper mantle. Fig. 1

Fig. 1. Azimuthal diagram of the group velocities of Rayleigh waves

Cord 2/3

ACC NR: AT7003838

is an azimuthal diagram of the group velocities. It shows that in the case of azimuths approaching 66° the mean velocities decrease for all periods, owing probably to the presence of such mountain chains as the Tien Shan along the wave path. At azimuths of about $72-74^\circ$, the velocities increase because of the influence of the thin crust of the Gobi desert region. It was established that the method of studying the velocity dispersion of surface seismic waves over extended paths, though it yields only mean values of the parameters of the Earth's crust for great distances, nonetheless is sensitive to differences in the structure of the layered medium in different directions from the point of observation. Velocity differences as a function of azimuth are most readily discernable in relatively shorter-period surface waves ($T = 10-35$ sec), owing to the dispersing influence of the Earth's crust. This influence decreases as the period increases, until the influence of the upper mantle predominates. At this point, velocity differences are no longer dependent on azimuth, indicating the greater homogeneity of the upper mantle in comparison with the crust. [DM]

Observed During Experimental Affection of Tis-
sue. I. The Changes on Tissue of the Affected
Intestine Loop Under the Effect of Largactil.

Orig Pub : Rev. med. (RPR), 1957, 3, No. 4, 17-22

Abstract : One ml of 0,1% histamine solution was injected
into the artery of the loop of the small intes-
tines of dogs. During the 5-7 days before and
after the operation, the animals received 5 mg/
kg of largactil (I) daily. Diffused peritoniti-
tis, inflammation, hyperemia, and reddish-brown
colouring of the intestine loop were noted in

Title : High speed milling of large steel plates
Periodical : Stan. i instr., 4, 40-41, Ap 1956
Abstract : For machining larger plates, e.g. 80x150x1050 or 60x1100x2180 mm, a special milling cutter 1130 mm in diameter and weighing 200 kilograms was designed and used in the 6662 model plano-milling machine manufactured by the Gor'kiy Milling Machine Plant. The authors give a concise description of the cutter, illustrating it with 3 drawings and 1 table.

TITLE: Investigation of the current-voltage characteristics of diffusion electron-hole junctions in silicon [Report the All-Union Conference on Semiconductor Devices, held in Tashkent from 2 to 7 October 1961]

SOURCE: Elektronno-dy*rochny*ye of perekhody* v poluprovodnikakh. Tashkent, Izd-vo AN UzSSR, 1962, 152-176

TOPIC TAGS: semiconductor, silicon p-n junction, diffusion silicon p-n junction

ABSTRACT: An extensive experimental investigation and comparisons of its results with existing theories are reported in the article. Current-voltage characteristics of silicon "sun batteries" studied by the authors in 1957 did not agree with the Shockley's "classical theory" (Bell Syst. Techn. J., 28, July, 1949); nor did it agree with the improved theory by C. T. Sah, R. Noyce, and W. Shockley (Proc. IRE, 9, 1957). A new method for manufacturing power silicon rectifiers by diffusing B into n-type Si was developed. The diffusion was conducted in air at high temperature. Resulting diodes with a 3.14-sq-cm p-n junction area passed about 1,000 amp of average rectified current (water cooling) and had a breakdown voltage

Card 1/3

L 13052-63

ACCESSION NR: AFJ002999

of 2,000 v. In 1962, power h-v diffusion Si rectifiers for 200 amp (air-cooled) and 350 amp (water-cooled), at 700 v were set in lot production. The following experiments are described in the article. Effects of applied reverse voltage on the capacitance and the width of space-charge region were determined. The reverse branch of the current-voltage characteristic was studied and interpreted in terms of space-charge-generated and recombination currents; also effects of junction environment (coating, etching, dry air, aging, kerosine, oil) on the current-voltage characteristic were investigated. The forward branch of the current-voltage characteristic was studied in detail: at low and medium voltages and at high injection levels; also effects of temperature were investigated. As the current-voltage relations in a Si p-n junction could not be fully explained by any existing theory, further experiments involved testing a diode, remodeling it into a photocell, testing the latter, remodeling it back into diode, and testing again. The "anomalous behavior" of the current-voltage characteristic is explained by the properties of its working surface. Finally, breakdown conditions of Si diodes were studied: effect of source Si resistivity on the breakdown voltage, effect of temperature on the current and voltage at which the current-voltage characteristic collapses, and effect of temperature on the reverse branch of the current-voltage characteristic. It was found that the thermal breakdown which usually occurs in Si p-n junctions is due to a "weak spot" on the surface of the

TITLE: Controlling the load of main marine diesels

B

SOURCE: Morskoy flot, no. 3, 1966, 30-31

TOPIC TAGS: diesel engine, marine engine, marine equipment, marine engineering

ABSTRACT: A method is proposed for controlling the load of main marine diesels based on setting up consecutive ratios between the velocity of the boat and the shaft speed of the engine. The speed of the vessel is given as v_1 while the engine rpm is designated by n_1 . If ship velocity and engine speed vary, reaching values of v_2 and n_2 , then $(v_1/n_2 - v_2/n_1) < 0$ shows a reduction in external resistance so that the power of the engine and velocity of the vessel may be increased, while if $(v_1/n_1 - v_2/n_2) > 0$, then the resistance of the vessel has increased and the engine is overloaded. When $v_1/n_1 = v_2/n_2$, engine operation should be watched. It is difficult at present for the mechanic on duty to detect engine overload, as Soviet vessels are not equipped with speed indicators or rudder aximeters. It is recommended that these instruments be included in the engine rooms of ships now being designed. The Department of Automation of Diesel and Gas Turbine Units at the Odessa Higher Engineering Naval College has developed a

Card 1/2

UDC: 621.436.001.4

L 46306-66

ACC NR: AP6021980

test computer which can determine the relative load level of the main engine from data on the relative vessel speed and engine rpm. The proposed engine control method was checked out operationally on the seagoing tug "Gordelivvy" and on mass-produced ships of the "Bezhitsa" type with satisfactory results. TITLE: Photoprotons from magnesium /Report, Fifteenth Annual Conference on Nuclear Spectroscopy and Nuclear Structure, held at Minsk, 25 January to 2 February 1965/

SOURCE: AN SSSR, Izvestiya. Seriya fizicheskaya. v. 30, no. 2, 1966, 378-382

TOPIC TAGS: nuclear reaction, nuclear cross section, magnesium, gamma interaction, gamma ray absorption, proton, proton emission

ABSTRACT: The authors have measured the energy and angular distributions of protons ejected from a 9.2 mg/cm^2 target of 99.9% pure magnesium of the natural isotopic composition by 23 and 34 MeV bremsstrahlung from a 35 MeV betatron and have determined the total $\text{Mg}^{24}(\gamma, p)$ cross section as a function of γ -ray energy in order to obtain data for comparison with theory on the giant dipole resonance in nuclei between C^{12} and O^{16} , for which "particle-hole" calculations based on the shell model are known to give a satisfactory description of the photodisintegration process, and Ca^{40} , for which similar calculations fail to account for a number of features of the process. The energy and angular distributions of the photoprotons were determined with 400 micron thick nuclear emulsions. The total cross section as a function of γ -ray energy was calculated by the method of Penfold and Leiss from yield curves measured with

Card 1/2

41308-66

ACC NR: AP6019636

scintillation spectrometers, using a 12.2 mg/cm^2 target. The angular distributions of the photoprotons with energies below 6.7 MeV were practically isotropic, indicating the participation in the photodisintegration process of a number of levels with different orbital angular momenta. The energy distribution of the photoprotons ejected by 23 MeV bremsstrahlung did not differ greatly from the distribution found by M.E.Toms and W.E. Stephens (Phys.Rev. 82, 709 (1951)), using 22.5 MeV bremsstrahlung, and by J.Yamamoto (J. Phys.Soc.Japan, 18, 11 (1961)), using 21.5 MeV bremsstrahlung. The (γ, p) cross section as a function of photon energy differed considerably from the cross sections measured by K.Shoda, K.Abe, T.Ishizuka, N.Kawamura, and by M.Kimura (J. Phys.Soc. Japan, 17, 735 (1962)); it was in better agreement with the (γ, n) cross section of J.Miller, C.Schul, G.Tomas, and C.Tzara (Preprint.Centre d'Etudes Nucleaires de Saclay, 1963) and the absorption cross section of B.S.Dolbilkin, V.A.Zapevalov, V.I.Korin, L.Ye.Lazereva, and F.A.Nikolayev (Conf. Rend. Congr. Internat. Phys.Nucl.Paris, 1964, vol. 2, 1060, Paris, 1964). The integrated (γ, p) cross section was 180 mb MeV; when that is added to the integrated (γ, n) cross section of Miller et al. (loc.cit.), the sum is 265 mb MeV, which may be compared with the value of 360 mb MeV given by the dipole sum rule. The authors thank N.N.Balamatov for assistance with the work. TITLE: Producing the Novikov Gears by Hot Rolling ✓

PERIODICAL: Vestnik mashinostroyeniya, 1960, No. 7, pp. 46 - 49

TEXT: The described experiments were undertaken to find out if the point-contact Novikov gears could be generated by hot rolling process used already in the industry for conventional involute profile gears. The load capacity of Novikov gears produced by cutting has been studied at the Gear Department of TsNIITM-ASH, and therefore same gear dimensions were used in the experiments with hot rolling to compare mechanical properties. TsNIITMASH used special milling cutters for Novikov pinion and gear wheel (Figs. 1 and 2, respectively), with different tooth contour arc radii. The hot rolling UR6MM-58 (TsK6MM-58) machine is shown in a photo (Fig. 4) with a gear blank installed between the bottom (indexing) rollers. Rolling on long blanks with subsequent cutting into single gears (as is practiced in rolling involute gears) was not possible because of slipping of the blank on the standard indexing pinion. Slipping caused either a wrong
